

ABSTRACT OF THE DISCLOSURE

An image display apparatus connected to external unit, comprises receiving section receiving remote-control codes sent from remote-control terminal, memory
5 storing conversion information causing identification information about remote-control code groups acceptable to external unit to correspond to external unit, converting section converting remote-control codes received by receiving section into remote-control codes
10 acceptable to external unit on basis of conversion information, transmitting section transmitting remote-control codes, detecting section detecting change in state of external unit corresponding to specific operation by use of remote-control terminal, setting-up
15 section which, when change in state of external unit has been sensed, determines identification information about remote-control code group including remote-control code making change in the state, creates conversion information to correspond to external unit,
20 and stores conversion information into memory, and control section which, when conversion information isn't stored in memory, creates conversion information and stores the information into memory.
